

Hager Companies is pleased to announce the release of a Restroom Kit (2-659-0368) and Emergency Kit (2-659-0372), both of which can be found in the Electrified Products section of the Hager website, price book, and catalog. During the past year, we have seen a steadily increasing demand for these products in project specifications.

How it Works | Restroom Kit

The restroom kit is intended to be used in single occupancy restrooms, including communicating restrooms where there are two doors that allow access to the restroom. The primary purpose of the restroom kit is to show when a restroom is available or occupied and when used with a low energy operator, the restroom kit can disable the exterior side actuators.

Step 1 - Activate the exterior "Push to Open" or "Wave to Open" push plate to initiate the 8300 Series Automatic Door Operator or simply manually open the door.

In a normally locked restroom, a key switch or keypad may be used in lieu of the push plate to gain access

Step 2 - Once inside the single occupancy restroom (and with the door closed), press the "Push to Lock" button. This action will illuminate both the interior "Push to Lock" button and exterior "Occupied When Lit" Indicator. It will also activate the locking hardware (i.e. electric strike) as well as to deactivate the exterior push plate actuator, preventing anyone from entering.

Step 3 - To exit, activate the interior "Push to Open" or "Wave to Open" push plate or manually open the door. Both actions will reset the system and door position switch (DPS) will send a signal to the logic relay telling it the door has been opened and to unlock the locking hardware.

The emergency kit addresses emergency call system requirements for single occupancy restrooms. If a person in the restroom needs emergency assistance, they simply press the red alarm button which illuminates the exterior sign and initiates an audible alarm. The kit includes both English and French signage.

As a note, the emergency kit does not provide access into the restroom. It simply alerts personnel that a person in the restroom needs help. How they gain access is dependent on the locking system.

How it Works | Emergency Kit

Where it Works | Restroom Kit & Emergency Kit

- Normally locked or normally unlocked single occupancy restrooms
- Where barrier free restrooms are required
- Where integrated locking systems are required
- Where an emergency call system is required.

What it Works With | Restroom Kit & Emergency Kit

- 8300 Series and 8400 Series Operators (for restroom kit)
- Push Plate Actuators and Touchless Actuators
- Electric Strikes
- Both kits can be used together

Please do not hesitate to reach out with any questions.

Sincerely,

Gordon Holmes
